

Android application center (apklis)

¹Yaiselis Ramirez Mastrapa

¹**Universidad de las Ciencias Informáticas (UCI), Cuba**

The main objective of an Android application center is to provide an official and reliable service for the distribution of Cuban and foreign applications for Android, thus enhancing the indigenous development of applications and providing a way to advertise the aforementioned products. This application center must have the basic functionalities of other existing ones (list, classify, categorize, search and install applications), as well as others that adapt it to the connectivity and cultural conditions of our country such as the installation of application data and future integration with available forms of payments.
